

Tool harness

The Skillers Flexi-System is a padded shoulder harness with a system of tool attachments designed to spread the weight of tools and equipment evenly, instead of transferring all of the weight to the wearer's hips and lower back, thereby reducing fatigue and the risk of accidents and back injuries.

The system allows tradespeople to customise their workwear to suit their individual particular needs with pouches and holders for a wide range of tools and equipment.

Components to the system include an ergonomically designed belt, padded shoulder harness and suspenders and several pouches that evenly spread the weight of tools and equipment on the wearer.

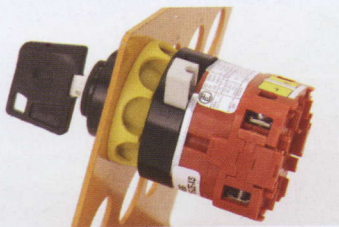

Accessories include a basic tool pouch, long tool pouch, large tool pouch, nail liner and mobile phone pouch.

Rotary cam switch

The Elektra range of 'C' mount cam switches is claimed to be quick and easy to mount, making it versatile to install in a wide range of applications.

Mounting the cam switch simply requires a 22.5 mm hole to be punched into a panel or door and a 3 mm notch key to prevent the switch from rotating during operation. Once the face plate and knob has been mounted, the switch body can be removed for wiring by simply flicking a lever to release. This is a helpful feature to reduce installation time and when installing in confined spaces.

The switch is available in 20, 25 and 32 A ratings and various switch configurations, including a 'key lockable' version.
